

Microsoft Sharepoint Connector

Datasheet: October 2018

The SharePoint Connector allows you to connect to SharePoint 2010, 2013, 2016 and Sharepoint Online. It fetches data from any site, document library, or list, and securely indexes both the full text and metadata of SharePoint documents, enabling a single searchable result set across content from multiple repositories. This allows organizations to tap into the wealth of information accessible within multiple versions of SharePoint and make that data instantly actionable to users through search. By including SharePoint content and applications in Fusion, you increase adoption of your intranet, improving efficiency and productivity.

Features	Supported	Additional Info
Sharepoint versions	2010, 2013, 2016, Online	
All searchable content types	✓	Site collections, sites, lists, list items and attachments, document libraries and sets, documents, blog posts, replies
Full content crawl	✓	
Incremental content refresh	✓	
Multi-threaded fetching	✓	Add multiple start-links to parallelize the crawling
Document level security	✓	Sharepoint users, Sharepoint groups, AD users, AD groups, nested AD groups
Content based deduplication	✓	Choose any searchable content to duplicate on
Content filtering	✓	Filter content on file size, extension, and name pattern matching
Document level security	✓	

Content Indexing

- Sharepoint content
 - Site collections, websites, and subsites
 - Lists, list items, and list item attachments
 - Document libraries, documents, and document sets
 - Personal websites
 - Blog post and replies
 - Web parts
- SSL
 - You can index a SharePoint site that uses HTTPS.
- Authentication
 - Basic authentication with Sharepoint user / password
 - Claims based (Windows NTLM, ADFS)
- Incremental refresh
 - The SharePoint connector automatically refreshes the content based on the last modified date since the last incremental refresh run
 - Deleted Sharepoint content can be optionally removed from the search index during the incremental refresh

Document Security

- The Sharepoint connector indexes permissions on SharePoints items using both Sharepoint group and Windows AD group memberships
- When a user performs a query, returned results are only those to which his Windows account has access
